

Meta Pixel Setup — Peak Studios CO

This document walks the **owner** through getting the Meta Pixel ID we need to plug into the landing page. The Pixel tracks who visits the site and who books a discovery call, which lets Meta optimize ad spend toward people likely to convert.

At the end you'll send your developer:

1. `NEXT_PUBLIC_META_PIXEL_ID` — a 15–16 digit number (e.g. 1234567890123456)
-

Step 1 — Open Meta Events Manager

1. Go to https://business.facebook.com/events_manager.
2. Sign in with the Facebook account that owns (or will own) the Peak Studios CO ad account.
3. If you don't have a Meta Business account yet, you'll be prompted to create one first. Use your business name and the email you want associated with billing.

Step 2 — Create the Pixel (a.k.a. "Web Data Source")

1. In Events Manager, sidebar → **Connect Data Sources** → **Web** → **Connect**.
2. Select **Meta Pixel** → **Connect**.
3. Name the dataset **Peak Studios CO Bookings** (anything is fine).
4. Enter the website URL (this can be the temporary Vercel URL or your final domain — doesn't matter, it's metadata).
5. Click **Continue**, then **Skip** any "set up via partner integration" prompts. We're installing the Pixel ourselves through the website code.

Step 3 — Copy the Pixel ID

1. After creation you land on the dataset's overview page.
2. Find the Pixel ID at the top (under the dataset name) — it's a 15–16 digit number like 1234567890123456 .
3. Copy it.

Step 4 — Send the value to your developer

Send Bryce one value:

Key	Value
NEXT_PUBLIC_META_PIXEL_ID	The numeric Pixel ID from Step 3

(This one isn't a secret — Meta Pixel IDs are visible to anyone who views your site's source. Sending it via Slack or plain email is fine.)

Dev steps once the Pixel ID arrives

When the owner sends the ID, the developer:

1. Open `.env.local` and set:

```
NEXT_PUBLIC_META_PIXEL_ID=1234567890123456
```

2. Restart the dev server (`pnpm dev`). The pixel base script is conditionally rendered in `app/layout.tsx` and only mounts when this env var is set — the `PageView` event fires automatically on every page load.
 3. The booking flow already calls `trackLead()` after a successful `POST /api/book`. No further wiring needed.
 4. **Verify in browser:**
 - Open Chrome DevTools → Network tab.
 - Load the landing page. You should see a request to `connect.facebook.net/.../fbevents.js` and a follow-up POST to `facebook.com/tr` with `ev=PageView`.
 - Complete a test booking. After the success screen, another `facebook.com/tr` POST should fire with `ev=Lead`.
 5. **Verify in Events Manager:**
 - Events Manager → your dataset → **Test Events** tab.
 - Enter the site URL and click **Open Website**.
 - `PageView` should appear within seconds; `Lead` appears after you complete a booking in that browser.
 6. For staging/production, set `NEXT_PUBLIC_META_PIXEL_ID` in Vercel project settings → Environment Variables. Vercel needs `NEXT_PUBLIC_*` vars at **build** time, so trigger a redeploy after adding it.
-

FAQ

Is the Pixel ID a secret?

No. It appears in the page source any time someone with browser dev tools loads the site. The `NEXT_PUBLIC_` prefix makes it explicit that this value is bundled client-side.

What does the Pixel actually send to Meta?

The base script fires `PageView` on every page load — page URL, referrer, anonymous browser fingerprint. The booking flow additionally fires `Lead` on success — same browser fingerprint, no PII like email or phone (we keep that server-side; the email send goes to Gmail SMTP, Meta does not see it).

What about iOS users with App Tracking Transparency disabled?

Meta uses Conversions API + browser-side Pixel together for resilience. We're only doing browser-side here, so iOS opt-outs reduce attribution accuracy somewhat. For Phase 4 this is fine; if attribution becomes a serious problem we can add server-side Conversions API as a follow-up.

Will this slow down my page?

The script loads `afterInteractive` (Next.js Script strategy), so it doesn't block initial render or first paint. Total weight is around 75 KB gzipped.
